

Window Tint Aftercare

A little patience now keeps your new film looking its best. Here's what to expect after your appointment at Low Price Auto Glass & Tint.

Wait 2 days before cleaning

Do not clean your windows for 2 days after installation.

Film dry-out: what to expect

Your new window film needs time to fully dry. Warm, sunny weather helps it dry faster; cold or cloudy weather slows the process. Your installer will advise you on the dry-out period for your film and the current weather.

Small water beads and slight cloudiness or haze are normal during dry-out. The film will clear up as it dries.

Before you drive home

Before leaving, ask your installer when you can roll your windows down. Follow the instructions given for your vehicle and film.

Care & maintenance — after the two-day wait

USE

- Clean, soft cloths or synthetic sponges
- Cleaning solution: ½ oz dish soap + 1 quart fresh water
- A soft rubber squeegee or a clean cloth for drying

AVOID

- Bristle brushes
- Abrasive scrubbers
- Dirty or reused cloths
- Rough paper towels — they can cause fine scratches over time
- Any ammonia products, including glass cleaners containing ammonia

Even with a scratch-resistant coating, improper cleaning can dull the film's polished look.

California tint law

Our shop is not responsible for window film that does not comply with California tint laws. It is the customer's responsibility to know the law or ask us before installation.
